

Elkamet – the Original

Elkamet – the Original has been a reliable partner to the advertising branch on the market for more than six decades now. Whether for classic illuminated lettering, pylons or 3D installations, you can rely on Elkamet profiles. Not within reason has the advertising industry long placed its trust in the quality of the original Elkamet edgings. We have therefore collaborated for many years now with international manufacturers and suppliers within the branch.

A metal foil is embedded into these profiles made of cellulose acetobutyrate in a special procedure. In this way, the Elkamet profiles are able to withstand any type of processing. They are scratch and water resistant and corrosion resistant. In addition, the exceptionally durable CAB material ensures that the shape and colour are retained even in difficult environmental conditions.

By using Elkamet profiles, you can make an active contribution towards environmental protection: in contrast to PVC profiles with the same construction, the Elkamet CAB edgings consist to 45% of the renewable natural raw material cellulose – that pays off even when recycling. In addition to the Elkamet standard profiles, which are available in many different colours, we are also happy to realise your individual profile acc. request drawings.

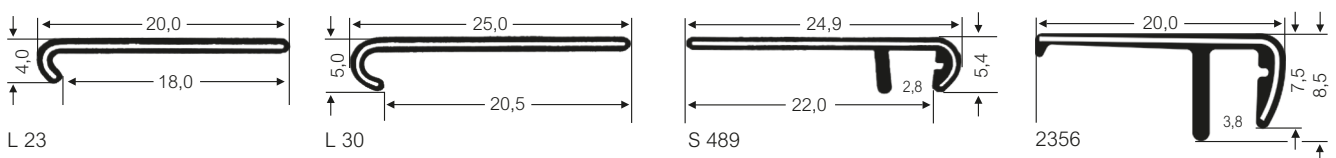

Specific properties:

- The profiles can be cut, sawn, adhered, bent, kinked, punched, printed and washed
- CAB is a highly impact and scratch resistant, sturdy and shock resistant material.
- High chemical and weather resistance
- CAB is fully flexible and can be bent as required without stress whitening
- The Elkamet profiles are water and corrosion resistant

Technical properties:

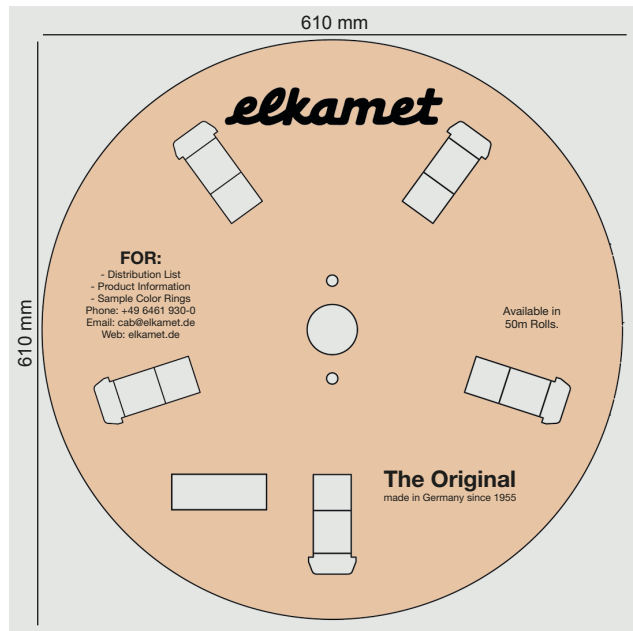

Material: CAB – cellulose acetobutyrate with embedded aluminium foil

Colours: Black, white, silver, fold, red, blue, green, yellow, orange and many further colours available on request, each in different colour shades and similar RAL colours

Delivery program

The delivery of the Elkamet profiles is as flexible as the edging itself and adapts to its respective project: in addition to bundles of 25 rods at a length of four metres, Elkamet also offers 50 metre rolls of the profile – so that you always have the right quantities in stock. This efficient solution saves both freight costs and valuable storage space. You also ensure that you can supply large projects and special requests. By processing 50 metres on the roll, you also avoid visible transitions through cut edges. Because we constantly have our products in stock, we are in a position to realise even short-notice lead times. Naturally, it is possible for us to mix several different colours in one delivery.

Quality

In contrast to similar products by other manufacturers, our profiles also prove their quality under test conditions. Neither UV radiation nor severe temperature fluctuations influence our edgings extensively regarding their appearance and characteristics. In the same way, the flexibility and therefore the ease of processing of the Elkamet edgings remains unrivalled.

Convince yourself of the performance capability of the Original Elkamet edgings! You can find your Contact in the Overview on www.elkamet.de
